Research Experience and Interests

Undergraduate Research (U.C. Santa Cruz): A novel GC/MS method was developed for the identification and characterization of polysaccharide natural products from marine alga.

Graduate Research (Columbia University): A general method was developed for construction of trans-hydrindanone ring systems, and the total synthesis of 11-keto steroids using an intramolecular Diels-Alder approach.

Postdoctoral Research (Yale University): Studies of the immunosuppressive drug cyclosporin A were performed to determine its effects on thymocyte populations in mice.

Postdoctoral Research (MIT): Studies were conducted on non-H-2 class I molecules of the mouse major histocompatibility complex. Our work showed that specific subpopulations of T cells expressed structurally diverse molecules encoded in the Qa-2 locus.

Biogen Research Corporation (Cambridge, MA): A molecular genetic study was conducted on insulin-specific, class II MHC restricted T cell receptors in mice. Further biochemical and molecular genetic studies were conducted on Qa-2 encoded MHC molecules.

John Innes Institute (Norwich, U.K.): A molecular genetic analysis of type II polyketide synthase systems was conducted to explore the identity and mechanism of construction of complex secondary metabolites in *Streptomyces*.

University of Michigan (Ann Arbor, MI): Research interests include synthetic chemistry, bioorganic and biochemical studies of natural product biosynthetic pathways from marine and terrestrial microbes. Metabolic engineering and microbial genomic and proteomic technologies are being developed and utilized for analysis and production of novel biologically active molecules and liquid fuels.
